No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
The present sequence is that of cDNA encoding the human mitotic checkpoint protein Chfr (see AAB20219) having a forkhead associated commain (FHA) and a ring finger domain. The protein is required for regulation of the transition of cells from prophase to metaphase during mitosis. It has ubiquitin-protein ligase activity. The Chfr checkpoint was evident in primary human cells but was inactivated in 4 of 8 human carcer cell lines. In U2OS cells, a mutation was identified, which caused a Val to Met amino acid substitution in the highly conserved C-terminal Cys-rich region of the Chfr protein. In the absence of the Chfr checkpoint, cells subjected to mitotic stress condensed their chromosomes despite failing to separate their chromosomes. Chfr may monitor C centrosome separation. Inactivation of the chfr gene in human cancer is theorized to underlie the increased sensitivity of cancer cells to comprise encoding at least amino acids 31-103, 303-346, 476-641 (or their antisense sequences) are claimed. The chfr cDNA was isolated from an expressed sequence tag database sequence for cDNAs with FHA motifs. C claimed methods of determining the tumourigenic potential of a cell comprise examining the cell for the presence of chfr nucleic acid (absence or mutation indicating predisposition to tumourigensis upon exposure to mitotic stress). Also claimed is a diagnostic agent, e.g. an antisense fragment of the present sequence, that binds to the chfr cancer is a cancer is a ligand selected from an antibody or its fragment. The Chfr may comprise a ligand selected from an antibody or its fragment. The Chfr can anditional antibumour therapsien for drugs which can cancer is inhibit the activity of Chfr and cancer cells. Chfr polypeptides are useful in screening for drugs which can can inhibit the activity of Chfr and cancer cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

CC length cDNAs defined in the specification. Where a primer set comprises:
CC (a) an oligo-dT primer and an oligonucleotide complementary to the
CC complementary strand of a polynucleotide which comprises one of the 5602
CC nucleotide sequences defined in the specification, where the
CC oligonucleotide comprises at least 15 nucleotides; or (b) a combination
CC of an oligonucleotide comprises as equence complementary to the
CC complementary strand of a polynucleotide which comprises a 5'-end
CC complementary strand of a polynucleotide which comprises a 5'-end
CC complementary strand of a polynucleotide which comprises a 5'-end
CC complementary strand of a polynucleotide which comprises a 5'-end
CC complementary strand of a polynucleotide which comprises a 1'-end sequence complementary to a
CC polynucleotide which comprises a 3'-end sequence complementary to a
CC oligonucleotide comprises at least 15 nucleotides and the combination of
CC the 5'-end sequence/3'-end sequence is selected from those defined in the
CC polynucleotide comprises at least 15 nucleotides and the combination of
CC the 5'-end sequence/3'-end sequence is selected from those defined in the
CC particularly full-length cDNAs. The primers are useful for synthesising polynucleotides,
CC particularly full-length cDNAs. The primers are also useful for the
CC detection and/or diagnosis of the abnormality of the proteins encoded by
CC cDNAs easily without any specialised methods. AAH03166 to AAH13628 and
CC cDNAs easily without any specialised methods. AAH03166 to AAH13628 and
CC cDNAs easily without any specialised methods. AAH03166 to AAH3628 and
CC cAAH13633 to AAH0368, all of which are used in the exemplification of the
CC consent inventor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Primer set

The present invention describes primer sets for synthesising 5602 full-
length cDNAs defined in the specification. Where a primer set comprises
(a) an oligo-dT primer and an oligonucleotide complementary to the
                                                             Primer sets for synthesizing polynucleotides, particularly the 5602 fullength cDNAs defined in the specification, and for the detection and/or length cDNAs defined in the specification, and for the detection and/or length of the abnormality of the proteins encoded by the full-length
                                                                                                                                                                                                                      28-JUL-2000; 2000EP-00116126

```
CC complementary strand of a polynucleotide which comprises one of the 5602 CC nucleotide sequences defined in the specification, where the coligonucleotide comprises at least 15 nucleotides; or (b) a combination cf an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end complementary to a complementary strand of a polynucleotide which comprises a 5'-end complementary to a complementary the complementary and in the complementary and in the complementary and in the complementary and in the full-length cDNAs. The primers are also useful for the complementary and analysis of the shormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and complementary invention and acid sequences; and AAH13629 to AAH13632 represent conjugation of the complementary invention.

FHARI is useful in the treatment of cancer, and as a vaccine for inducing an immunological response in a mammal. FHARI polynucleotides may also be used as a diagnostic reagent through detection of mutations in the associated gene, and for chromosome localization studies, and tissue expression studies. FHARI antibodies are useful to isolate and to identify clones expressing the polypeptides, or to purify the polypeptides by affinity chromatography and to treat cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 1995 BP; 465 A; 563 C; 580 G; 387 T; 0 U; 0 Other;

A polynucleotide of the invention may have a use in gene therapy. An oligonucleotide of the invention ADM06202-ADM06773 is useful as a primer for synthesizing the polynucleotide or as a probe for detecting the polynucleotide. The polynucleotides ADM01316-ADM03758 are useful in gene therapy, for developing a diagnostic marker or medicines for regulating their expression and activity, or as a target of gene therapy. The proteins ADM03759-ADM062701 encoded by the polynucleotides are useful as pharmaceutical agents. The present sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 2448
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New polynucleotides and polypeptides are useful developing a diagnostic marker or medicines for expression and activity, or as a target of gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Local Similarity
